Enterprise Sales Intelligence

One-Page User Guide

1. Project Overview

Enterprise Sales Intelligence is an interactive Power BI dashboard developed using the Microsoft AdventureWorks sample dataset. It helps users analyze sales performance, profitability, and regional business trends.

2. How to Use the Dashboard

- Open the .pbix file using Power BI Desktop.
- View KPI cards to understand overall business performance.
- Use the **Year slicer** to filter sales data by year.
- Use the **Region slicer** to analyze specific regions.
- Interact with charts and visuals to explore sales trends.
- Use the regional drill-through feature to view detailed regional information.

3. Understanding Key KPIs

- **Total Sales:** Overall revenue generated.
- **Total Profit:** Profit earned from sales.
- **Total Orders:** Number of sales orders.
- **Profit Margin:** Percentage of revenue retained as profit.

4. Data Refresh Process

The dashboard is currently maintained in Power BI Desktop and is not published to Power BI Service.

To refresh the dashboard manually:

1. Open the project .pbix file in Power BI Desktop.
2. Navigate to the **Home** tab.
3. Click the **Refresh** button.
4. Wait until the data refresh process is completed.
5. Review the updated dashboard visuals and KPI values.
6. Save the report after refreshing.

Note: The dashboard must be refreshed manually whenever the underlying source data is updated.

5. Deployment Status and Limitation

The dashboard has not been published to Power BI Service because the project was developed and demonstrated in a local environment, and Power BI Service deployment with an appropriate data gateway and scheduled refresh configuration was outside the available setup.

Therefore, users can access and refresh the dashboard locally through Power BI Desktop.

6. Support

For technical issues or questions regarding the dashboard, refer to the project documentation or contact the project developer.
